Summary

Applied CS student in my final year, with a completed associates and a three-month internship behind me. I build backends in Python and C# and frontends in React, Vue and TypeScript. My main project is Yorimichi, a route planning engine with a custom A* implementation, built in a hexagonal architecture. I recently delivered a bilingual website for a client in Yokohama.

Skills

Languages & Backend

C#, Python, SQL · .NET/MVC, REST APIs, FastAPI, SQLAlchemy, OpenSearch, hexagonal architecture, TS, JS

Frontend & Geospatial

React, Vue 3, Astro, Tailwind, WebGL/Three.js · PostgreSQL/PostGIS, OSMnx, NetworkX

Tooling & Testing

Docker, Git, CI/CD, Linux, Netlify, unit and integration testing, postman, pytest

Languages

Dutch (native) **English (fluent)** **French (fluent)** **Japanese (studying N4)**

Education

Howest University of Applied Sciences Bachelor

Applied Computer Science Bruges, Belgium • Sep 2025 — Jun 2027

Howest University of Applied Sciences Associates • magna cum laude

Programming Bruges, Belgium • Sep 2023 — Sep 2025

Experience

Vanden Broele Bruges, Belgium

Software Development Intern Mar 2025 — May 2025

Designed a high-performance document search system using OpenSearch, replacing legacy SQL-based queries. Implemented a secure multi-tenant architecture and real-time dashboards with anomaly detection. Stack: .NET 9, Vue 3, Tailwind CSS, Docker, OpenSearch.

Projects

Yorimichi (寄り道) ongoing

Designed a custom Scenic A* algorithm with per-edge cost weighting, prioritizing scenic value over shortest path. Built with hexagonal architecture; swappable graph backends (OSMnx and PostGIS) processing ~20M nodes / 44M edges. Stack: Python 3.12, FastAPI, PostgreSQL/PostGIS, SQLAlchemy, React/TypeScript.

Interactive Portfolio

WebGL 3D scenes with React Three Fiber and Drei, procedural canvas rendering (Perlin noise, particle systems). Migrated from Create React App to Vite: cold start from roughly 30–60s to 437ms. Raised the Lighthouse desktop score from 25 to 78 by self-hosting textures and fonts. Stack: React, SCSS, React Three Fiber, Vite.

Bilingual consultant website (client work)

Built a production EN/JA site in Astro with React islands and Sanity CMS. Designed a field-level bilingual content model so the client edits both languages in one place, with automatic EN fallback when a Japanese field is empty; Sanity webhooks trigger Netlify rebuilds. Separate routes per language for independent indexing, hreflang/canonical. Stack: Astro, React, TS, Sanity, Netlify.
